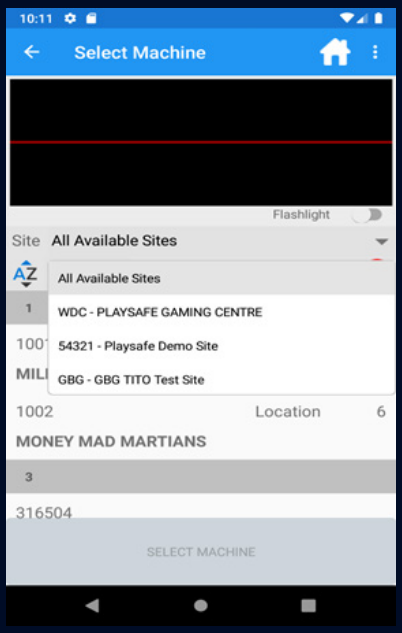
Quantum Handheld Updates

Feature #3742: Multi-Site Support

In previous versions, for customer systems that have multiple sites defined, the machine selection screen would always offer all known machines across all sites.

In v4.2 if multiple sites exist, then an additional drop down list is available to select machines for a single selected site only, or machines for “All Sites”. If there is only a single site, this list is hidden.

This new feature can help for example, if the user is entering meter readings for machines in a single site only.

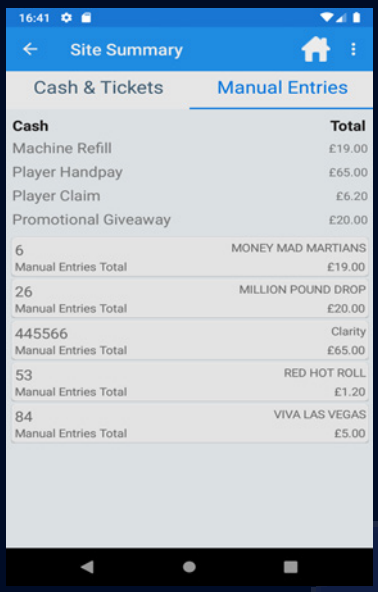


Feature #3764: Site Totals Now Includes Manual Entry Items

In previous versions, the “Review Site Summary” option on the “Review Data” screen summarised cash and ticket counts only.

In v4.2 there is now an additional tabbed page to review manual entries by site too.

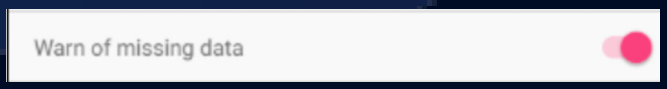
This will display
- Site totals by manual entry type, for all machine
- Machine total, for all manual entry types



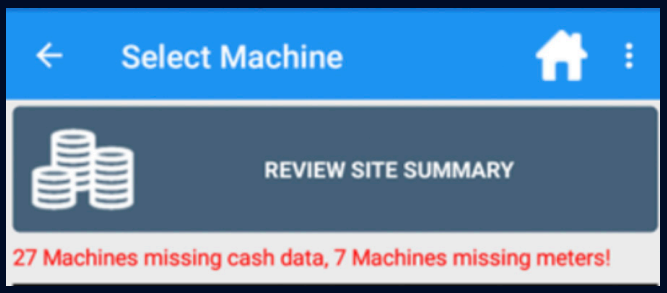
Feature #3860: Warn User Of Missing Data

Handheld v4.2 now has an additional setup option controlling whether or not the user should be alerted to “missing data” (cash counts and/or meter readings).

If this option is enabled, then it alerts the user to missing data:

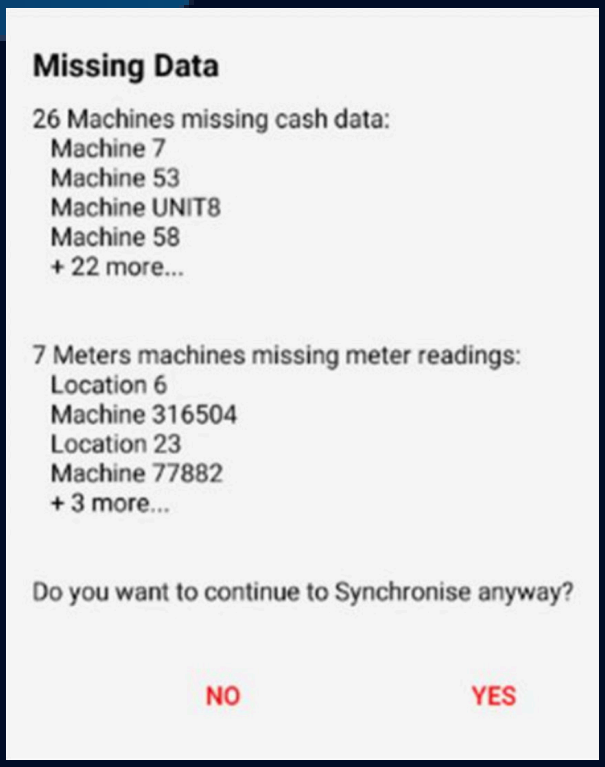


On reviewing data:



Tip: No warnings are expected if there is no data available for upload (i.e immediately after a sync)

Before synchronising with Quantum



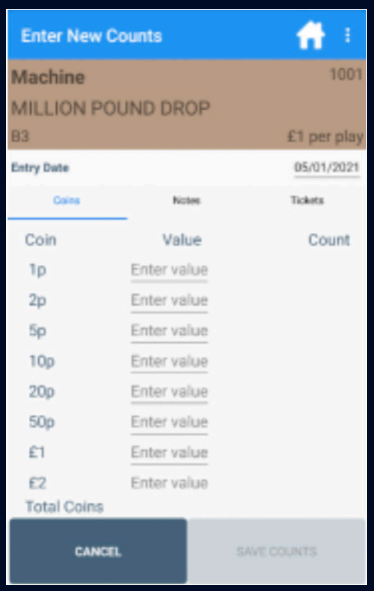
Tip: If the “Show Locations” setup option is enabled then machines will be identified via location no. (if available) rather than machine reference.

Feature #3990: Counted Cash To Be Able To Be Entered As Count Or Value

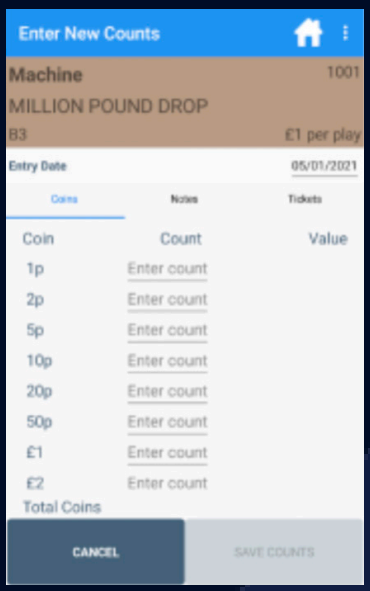
In previous versions of Handheld cash counts could be manually entered by inputting the quantity (count) of each coin & note denomination.

Handheld v4.2 now has an additional setup option controlling whether or not the user is expected to enter the denomination counts, or the total values

Where value is enabled the screen dispays:



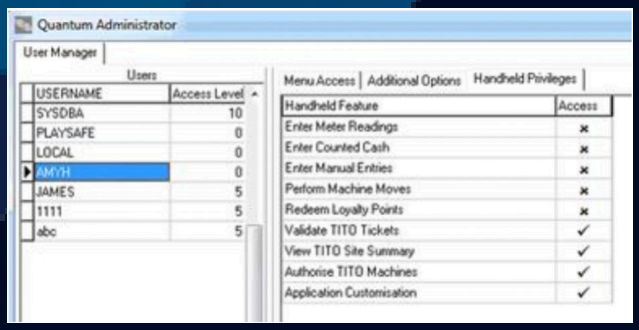
Where count is enabled the screen displays:

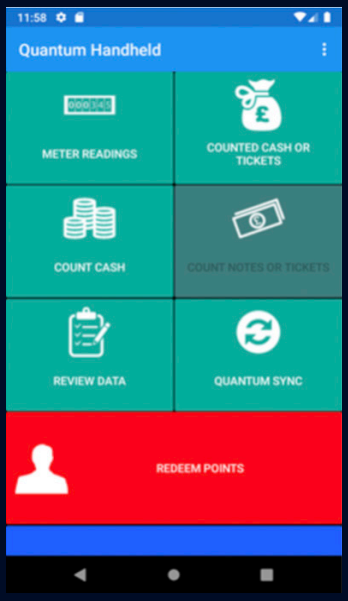


Feature #4102: Quantum Controlled Privileges

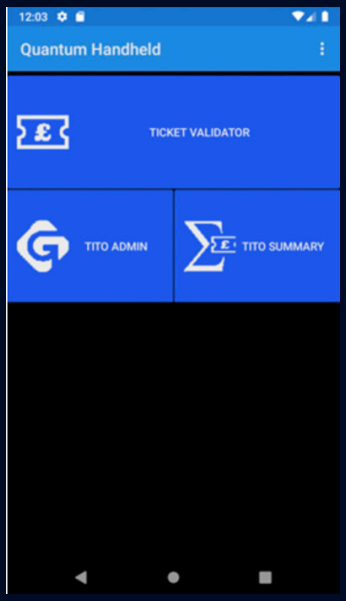
Using QAdmin v6.1.39 or later, the user is able define Handheld privileges per user.

On Handheld v4.2 these assigned privileges are applied per user and affect which menu options are available.

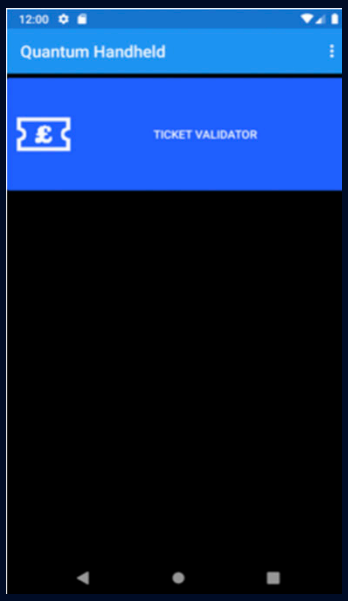




Manager



Supervisor



Ticket Validation Only

Tip: Within Settigns if a user has the priviledge to access a feature, the user may still choose to not have that feature offered on the main menu.

However, if the user does not have the priviledge, then although the feature may be visible within Settings, the option is read only and the user cannot select whether the feature will be offered or not, and the feature will never be offered to that user on the main menu.

Feature #3599: Ability to redeem an TITO ticket which has previously expired

Various bug fixes and performance improvements detailed in full release notes, which can be provided upon request.
